

## **AMENDMENTS TO THE CLAIMS**

1. **(Previously Amended)** A polyurethane resin composition for forming a polarized lens, comprising a polyisocyanate, a polyhydroxy compound and an aromatic polyamine, wherein (1) said polyisocyanate is 4,4'-methylene-bis(cyclohexyl isocyanate) or isophorone diisocyanate, (2) said polyhydroxy compound is a polyether diol or a polyester diol having an average molecular weight of 700-1200, or a mixture thereof, (3) said aromatic polyamine is 4,4'-methylene-bis(2-chloroaniline), and (4) said polyisocyanate and said polyhydroxy compound are reacted to form a polyurethane prepolymer, the reaction molar ratio of said polyisocyanate to said polyhydroxy compound (NCO/OH) is 2.5 to 4.0, and the NCO content of the polyurethane prepolymer is 7.0 to 14.0%.

### **Claims 2-4 (Cancelled)**

5. **(Previously Amended)** An impact-resistant polarized optical lens, comprising the polyurethane resin composition as claimed in claim 1.

6. **(Previously Amended)** The impact-resistant polarized optical lens as claimed in claim 5, which is a transparent lens, sunglass lens or polarized lens.

7. **(Currently Amended)** A method of casting a polyurethane resin into an impact-resistant polarized optical lens, comprising

reacting a polyisocyanate with a polyhydroxy compound to obtain a polyurethane prepolymer wherein the reaction molar ratio of said polyisocyanate to said polyhydroxy compound (NCO/OH) is 2.5 to 4.0, and the NCO content of the polyurethane prepolymer is 7.0 to 14.0%,

mixing the polyurethane prepolymer with an aromatic polyamine to obtain said polyurethane resin, wherein the reaction molar ratio of said polyurethane prepolymer to said aromatic polyamine (NCO/NH<sub>2</sub>) is 1.10 to 0.90, and

casting and curing said polyurethane resin at 60-120°C, to obtain the impact-resistant polarized optical lens.
